# Overview

# 1 The context

2 Routing packets with fixed communication routes

3 Resolution of the "fluidified" problem

4 Building a schedule

5 Routing packets with freedom on the communication paths

#### Platform : heterogeneous and distributed :

- processors with different capabilities;
- communication links of different characteristics.

# Applications

Application made of a very (very) large number of tasks, the tasks can be clustered into a finite number of types, all tasks of a same type having the same characteristics.

When we have a very large number of identical tasks to execute, we can imagine that, after some initiation phase, we will reach a (long) steady-state, before a termination phase.

If the steady-state is long enough, the initiation and termination phases will be negligible.

# Overview

### The context

#### 2 Routing packets with fixed communication routes

- 3 Resolution of the "fluidified" problem
- 4 Building a schedule

5 Routing packets with freedom on the communication paths

Problem : sending a set of message flows.

In a communication network, several flow of packets must be dispatched, each packet flow must be sent from a route to a destination, while following a given path linking the source to the destination.

# $\blacktriangleright~(V,A)$ an oriented graph, representing the communication network.

► (V, A) an oriented graph, representing the communication network.

  - ▶ s<sub>k</sub> is the source of packets;
  - ► *t<sub>k</sub>* is the destination ;
  - ▶ *P<sub>k</sub>* is the path to be followed ;

► (V, A) an oriented graph, representing the communication network.

- ▶ A set of *n<sub>c</sub>* flows which must be dispatched.
- ▶ The k-th flow is denoted  $(s_k, t_k, P_k, n_k)$ , where
  - ▶ *s<sub>k</sub>* is the source of packets;
  - ► *t<sub>k</sub>* is the destination;
  - $P_k$  is the path to be followed;
  - n<sub>k</sub> is the number of packets in the flow.

- ► (V, A) an oriented graph, representing the communication network.
- ▶ A set of *n<sub>c</sub>* flows which must be dispatched.
- ▶ The *k*-th flow is denoted  $(s_k, t_k, P_k, n_k)$ , where
  - sk is the source of packets;
  - ▶ *t<sub>k</sub>* is the destination;
  - ▶ *P<sub>k</sub>* is the path to be followed;
  - n<sub>k</sub> is the number of packets in the flow.
     We denote by a<sub>k,i</sub> the *i*-th edge in the path P<sub>k</sub>.

#### $\blacktriangleright$ A packet goes through an edge A in a unit of time.

► A packet goes through an edge A in a unit of time.

► At a given time, a single packet traverses a given edge.

We must decide which packet must go through a given edge at a given time, in order to minimize the overall execution time.

We call **congestion** of edge  $a \in A$ , and we denote by  $C_a$ , the total number of packets which go through edge a:

$$C_a = \sum_{k \mid a \in P_k} n_k \qquad C_{\max} = \max_a C_a$$

We call **congestion** of edge  $a \in A$ , and we denote by  $C_a$ , the total number of packets which go through edge a:

$$C_a = \sum_{k \mid a \in P_k} n_k \qquad C_{\max} = \max_a C_a$$

 $C_{\max}$  is a lower bound on the execution time of any schedule.  $C^* \geq C_{\max}$ 

We call **congestion** of edge  $a \in A$ , and we denote by  $C_a$ , the total number of packets which go through edge a:

$$C_a = \sum_{k \mid a \in P_k} n_k \qquad C_{\max} = \max_a C_a$$

 $C_{\max}$  is a lower bound on the execution time of any schedule.  $C^* \geq C_{\max}$ 

A "fluid" (fractional) resolution of our problem will give us a solution which executes in a time  $C_{\max}$ .

# Overview

### The context

2 Routing packets with fixed communication routes

3 Resolution of the "fluidified" problem

4 Building a schedule

5) Routing packets with freedom on the communication paths

# Fluidified (fractional) version : notations

#### Principle :

▶ we do not look for an integral solution but for a rational one.

# Fluidified (fractional) version : notations

#### Principle :

• we do not look for an integral solution but for a rational one.

 n<sub>k,i</sub>(t) (fractional) number of packets waiting at the entrance of the *i*-th edge of the *k*-th path, at time t.

# Fluidified (fractional) version : notations

#### Principle :

• we do not look for an integral solution but for a rational one.

- n<sub>k,i</sub>(t) (fractional) number of packets waiting at the entrance of the *i*-th edge of the *k*-th path, at time t.
- ► T<sub>k,i</sub>(t) is the overall time used by the edge a<sub>k,i</sub> for packets of the k-th flow, during the interval of time [0; t].

Initiating the communications

$$n_{k,1}(t) = n_k - T_{k,1}(t),$$
 for each  $k$ 

#### Initiating the communications

$$n_{k,1}(t) = n_k - T_{k,1}(t),$$
 for each  $k$ 

#### Onservation law

$$n_{k,i+1}(t) = T_{k,i}(t) - T_{k,i+1}(t),$$
 for each k

#### Initiating the communications

$$n_{k,1}(t) = n_k - T_{k,1}(t),$$
 for each  $k$ 

Onservation law

$$n_{k,i+1}(t) = T_{k,i}(t) - T_{k,i+1}(t), \qquad \text{ for each } k$$

#### In the second second

$$\sum_{(k,i) \mid a_{k,i}=a} T_{k,i}(t_2) - T_{k,i}(t_1) \le t_2 - t_1, \forall a \in A, \forall t_2 \ge t_1 \ge 0$$

#### Initiating the communications

$$n_{k,1}(t) = n_k - T_{k,1}(t),$$
 for each  $k$ 

Onservation law

$$n_{k,i+1}(t) = T_{k,i}(t) - T_{k,i+1}(t),$$
 for each  $k$ 

8 Resource constraints

 $\sum_{(k,i) \mid a_{k,i}=a} T_{k,i}(t_2) - T_{k,i}(t_1) \le t_2 - t_1, \forall a \in A, \forall t_2 \ge t_1 \ge 0$ 

Objective

MINIMIZE 
$$C_{\text{frac}} = \int_0^\infty \mathbb{1}\left(\sum_{k,i} n_{k,i}(t)\right) dt$$

►  $a_{k,1}$  sends  $m_k$  packets during  $[0, \Omega + D_{\max}]$ .  $N_{k,1}(\Omega + D_{\max}) = n_k - m_k$ 

- N<sub>k,i</sub>(t) : number of packets of the k-th flow waiting at the entrance of the i-th edge, at time t.
- ►  $a_{k,1}$  sends  $m_k$  packets during  $[0, \Omega + D_{\max}]$ .  $N_{k,1}(\Omega + D_{\max}) = n_k - m_k$
- ►  $a_{k,1}$  sends  $m_k$  packets during  $[\Omega + D_{\max}, 2(\Omega + D_{\max})]$ .  $N_{k,1}(2(\Omega + D_{\max})) = n_k - 2m_k$

- N<sub>k,i</sub>(t) : number of packets of the k-th flow waiting at the entrance of the i-th edge, at time t.
- ►  $a_{k,1}$  sends  $m_k$  packets during  $[0, \Omega + D_{\max}]$ .  $N_{k,1}(\Omega + D_{\max}) = n_k - m_k$
- ►  $a_{k,1}$  sends  $m_k$  packets during  $[\Omega + D_{\max}, 2(\Omega + D_{\max})]$ .  $N_{k,1}(2(\Omega + D_{\max})) = n_k - 2m_k$

• We let 
$$T = \left\lceil \frac{C_{\max}}{\Omega} \right\rceil (\Omega + D_{\max})$$

$$N_{k,1}(T) \le n_k - \frac{T}{\Omega + D_{\max}} m_k \le n_k - \frac{n_k \Omega}{C_{\max}} \frac{C_{\max}}{\Omega} = 0$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 - のへで

#### Propagation delay

- ►  $a_{k,1}$  sends  $m_k$  packets during  $[0, \Omega + D_{\max}]$ .  $N_{k,1}(\Omega + D_{\max}) = n_k - m_k$   $N_{k,2}(\Omega + D_{\max}) = m_k$  $N_{k,i\geq 3}(\Omega + D_{\max}) = 0$
- $\begin{array}{ll} \bullet & a_{k,1} \text{ sends } m_k \text{ packets during } [\Omega + D_{\max}, 2(\Omega + D_{\max})].\\ & N_{k,1}(2(\Omega + D_{\max})) = n_k 2m_k & N_{k,2}(2(\Omega + D_{\max})) = m_k \\ & N_{k,3}(2(\Omega + D_{\max})) = m_k & N_{k,i \ge 4}(2(\Omega + D_{\max})) = 0 \end{array}$
- The delay between the time a packet traverses the first edge of the path P<sub>k</sub> and the time it traverses its last edge is, at worst : (|P<sub>k</sub>| − 1)(Ω + D<sub>max</sub>) We let L = max<sub>k</sub> |P<sub>k</sub>|.

$$C_{\text{total}} \leq T + (L-1)(\Omega + D_{\max})$$

## Resources needed

$$\sum_{(k,i)|a_{k,i}=a,k\geq 2} m_k \leq \sum_{(k,i)|a_{k,i}=a,k\geq 2} \left(\frac{n_k}{C_{\max}}\sqrt{\frac{D_{\max}C_{\max}}{L}} + 1\right)$$
$$\leq \sqrt{\frac{D_{\max}C_{\max}}{L}} + D_{\max}$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへ⊙

## Conclusion

- We forget the initiation and termination phases
- Rational resolution of the steady-state
- Round whose size is the square-root of the solution :
  - Each round "loses" a constant amount of time
  - The sum of the waisted times increases less quickly than the schedule

packets which go from k to l.

## Routing algorithm

- **2** Let  $\Omega$  be some value later defined. During the interval  $[p\Omega, (p+1)\Omega]$ , the edge (i, j) forwards :

$$m_{i,j}^{k,l} = \left\lfloor \frac{n_{i,j}^{k,l}\Omega}{C_{\max}} \right\rfloor$$

packets which go from k to l.

Starting at time :

$$T \equiv \left\lceil \frac{C_{\max}}{\Omega} \right\rceil \Omega \le C_{\max} + \Omega$$

we process the M remaining sequentially, which takes a time ML (at worst) where L is the maximal length of a simple path in the network.

## The schedule is feasible

$$\sum_{(k,l)} m_{i,j}^{k,l} \le \sum_{(k,l)} \frac{n_{i,j}^{k,l}\Omega}{C_{\max}} = \frac{C_{i,j}\Omega}{C_{\max}} \le \Omega$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- We define  $\Omega$  by :  $\Omega = \sqrt{C_{\max}n_c}$ .
- The total number of packets remaining in the network at time T is at worst :

$$2|A|\sqrt{C_{\max}n_c} + |A|n_c$$

The makespan is then

$$C_{\max} \le C^* \le C_{\max} + \sqrt{C_{\max}n_c} + 2|A|\sqrt{C_{\max}n_c}|V| + |A|n_c|V|$$
