5 Conclusion

Introduction	Related Work	DLPT	Protocol 00000000000	Conclusion
DIDT				

DLPT - original design

- Distributed Lexicographic Placement Table
- On-line building of a Greatest Common Prefix Tree
- Mapping
 - DHT-based (load balancing)
 - each physical node maintains one or more nodes of the locical GCP Tree
- Replication based fault-tolerance
- Greedy locality awareness

DLPT - logical structure (1/2)

- Alphabet A finite set of letters
- Word *w* finite set of letters of *A*, $w = a_1, \ldots, a_i, \ldots, a_l, l > 0$
- *u*, *v* two words, *uv concatenation* of *u* and *v*
- Image: weight weight
- ϵ the empty word, $|\epsilon| = 0$

DLPT

DLPT - logical structure (2/2)

- u = prefix(v) if $\exists w \text{ s.t. } v = uw$
- GCP(w₁, w₂,..., w_i,..., w_n) is the longest prefix shared by w₁, w₂,..., w_i,..., w_n
- GCP Tree labeled rooted tree s.t.
 - The node label is a proper prefix of any label in its subtree
 - The node label is the Proper Greatest Common Prefix of all its son labels

Introduction	Related Work	DLPT	Protocol 00000000000	Conclusion

DLPT - on-line construction

- Contact
- Routing
- Inserting

◆□ > ◆□ > ◆三 > ◆三 > ・三 ・ のへで

Introduction	Related Work	DLPT	Protocol	Conclusion
Routing				

- Object *o* to be inserted
- L set of labels currently in the tree

$$p = max_{|m|} \{m \mid m = GCP(I, o), I \in L\}$$

$$U = \{I \in L \mid GCP(I, o) = p\}$$

• t target label of the routing

$$t = min_{|u|} \{u \in U\}$$

Introduction	Related Work	DLPT	Protocol	Conclusion
Inserting				

- Once the target is found, four cases :
 - $t = o \rightarrow \text{insert } o \text{ on } node(t)$
 - $o = tu (u \neq \epsilon)$
 - new node *node*(*o*) son of *node*(*t*)
 - insert o on node(o)

•
$$t = ou (u \neq \epsilon)$$

- new node node(o) father of node(t)
- insert o on node(o)
- Default
 - node(t) and node(o) siblings (no father)
 - new node *node*(*o*) father of *node*(*t*)
 - new node node(GCP(o, t)) father of node(t) and node(o)
 - insert o on node(o)

- Static replication factor k
- Greedy locality awareness
- Periodically initiated by the root
- Replication of the root
- Election of one replica to launch the process in the subtree

- Multicriteria lookup

Querying

Cédric Tedeschi A Prefix Tree for Searching over P2P Platforms

17/35

Introduction	Related Work	DLPT	Protocol oooooooooooo	Conclusion
Complexities	S			

- N size of the tree
- Assumptions
 - A finite
 - T upper bound on the length of the labels
- Number of hops of routing bounded by 2T
- Local state bounded by |A|
- Local decision of routing in O(1)
- (Multicriteria) range query, replication/locality process
 - Iatency bounded by T
 - linear number of messages

イロト イポト イヨト イヨト 三日

Replicating or repairing?

- Replication
 - Preventing approach
 - How to tune the replication factor?
 - Costly to maintain (resources/local state)
- Repair
 - let the tree split into a forest
 - a posteriori reconnection and reordering of nodes

< ロ > < 同 > < 回 > < 回 > .

Introduction	Related Work	DLPT	Protocol	Conclusion
Two phases	3			

- Tree recovery
- Tree reorganization

Introduction	Related Work	DLPT	Protocol ●oooooooooo	Conclusion
Tree recovery				
Local rec	onnection			

- p detects the lost of its father
- Obtain the set of remaining physical nodes PN (DHT traversal)
- *p* builds the set of remaining logical nodes *N*
- p computes the set of nodes in its subtree T
- Choose a temporary father within $N \setminus T$
- If $N \setminus T = \emptyset$, *p* is the root of the tree
- Drawback : cycles may appear

・ 同 ト ・ ヨ ト ・ ヨ ト ・ ヨ

- Temporary father tf
- p sends a HELLO message to tf
- On receipt, *tf* forwards the HELLO to its own (temporary) father
- Step by step, two possible situations
 - The real root is reached (sends a message NO_CYCLE)
 - Local ID is the ID of the initiator
 - A cycle is detected
 - The cycle is broken (leader election)

イロト イポト イヨト イヨト 三日

Introduction	Related Work	DLPT	Protocol oo●oooooooo	Conclusion
Tree recovery				
Correctne	ess proof (1/2)			

Assumption 1

If a node crashes at time *t*, then for every t' > t, no crash occurs.

Lemma 1

Under Assumption 1, the recovery protocol terminates, and when this occurs, the system contains one tree only.

イロト イポト イヨト イヨト 三日

DLPT

Tree recovery

Correctness proof (2/2)

Proof

- By contradiction, assume no node sends a NO CYCLE message
- A HELLO message never reaches the real root
- Every HELLO messages traverses only cycles
- When the initiator of a HELLO message receives it, a cycle is broken
- Cycles must be infinitely created
- C the number of cycles, each one composed of at least two nodes
- When cycles are broken, at most C/2 leaders reconnects to another tree
- In the next phase, $C' \leq C/2$ reaching 0 (since no other crashes occurs)

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ◆ ○ ○ ○

Each node p having a false son q initiates the routing of qTwo cases :

- q = prefix(p), p moves q to its father
- p = prefix(q), four cases.

(i) p.val = prefix(q) and $p.val = GCP(s_1, ..., s_k)$.

DLPT

Tree reorganization

Routing of the false sons (2/2)

(a) There exists s_i such that

(c) There exists s_i such that $GCP(q.val, s_i.val) > p.val$.

(b) There exists s_i such that $q.val = prefix(s_i.val)$.

(d) p.val = prefix(q.val).

・ロト ・ 一 ・ ・ ヨ ・ ・ ヨ ・

- New objects can be inserted during the recovery phase
- A new subtree may have been created at the place of a false root
- Need to merge two trees
- initiated by a MERGE message

Introduction	Related Work	DLPT	Protocol ○○○○○○○●○○○	Conclusion
Tree reorganization				
Correctness proof (1/3)				

Lemma 2

Under Assumption 1 and assuming that the system contains one tree only, the reorganization protocol terminates, and when this occurs, the tree is a *GCP* Tree.

・ロト ・ 同 ト ・ ヨ ト ・ ヨ ト ・ ヨ

Introduction	Related Work	DLPT	Protocol ○○○○○○○○○	Conclusion
Tree reorganization				
Correctness	proof (2/3)			

Proof (1/2)

If no merging is required. Two cases

- 1. p = prefix(fs)
 - refer to previous figure
 - all cases clearly results in GCP Trees

2. $p \neq prefix(fs)$

- a. *p.father* = \perp
 - *fs* = *prefix*(*p*) *fs* becomes the root node (GCP Tree)
 - fs and p becomes the two sons of the root node labeled GCP(p, fs) (GCP Tree)
- b. *p.father* $\neq \perp$, *fs* is moved to *p.father*
 - eventually reach q s.t. q = prefix(fs) (Case 1.)
 - eventually reach the root of the tree (Case 2.a.)

Introduction	Related Work	DLPT	Protocol ○○○○○○○○○○	Conclusion
Tree reorganization				
Correctne	ss proof (3/3)			

Proof (2/2)

If merging is required. Four cases

i $\exists s_i, s_j \text{ s.t. } s_i = prefix(s_j)$

• s_i is moved to s_i

similar to previous Case 1. (a) and (b) on previous figure

ii $\exists s_i, s_j \text{ s.t. } GCP(s_i, s_j) > p$

s_i and s_j sons of a new node GCP(s_i, s_j)

similar to previous Case 1. (c) on the previous figure

iii $\exists s_i, s_j \text{ s.t. } s_i = s_j$

- recursive merging between s_i and s_i
- solved by induction on s_i and s_j
- $\nexists s_i, s_j$ satisfying either (i), (ii) or (iii) (GCP Tree)

・ロト ・ 同 ト ・ ヨ ト ・ ヨ ト ・ ヨ

Introduction	Related Work	DLPT	Protocol ○○○○○○○○○○●	Conclusion
Tree reorganization				

From Lemmas 1 and 2 follows :

Theorem 1

Under Assumption 1, our protocol provide a *GCP* tree reconstruction after the crash of a physical node.

Introduction	Related Work	DLPT	Protocol	Conclusion

5 Conclusion

Introduction	Related Work	DLPT	Protocol oooooooooooo	Conclusion
Conclusion				

- Fault-tolerance protocol facing node crashes in a GCP Tree
 - Reconnection and reorganization of subtrees
 - Guaranty of recovering a GCP Tree after a finite time
 - Avoid/coupled with a replication strategy
- Future Work
 - Connecting replication and repair mechanisms to minimize the cost of fault-tolerance
 - Develop and validate a prototype on the Grid'5000 platform
